

Cost ratio per GPU (MI250X affected by stack max constant)

NZ_STACK_MAX is a COMPILE-TIME bound, so it sets the per-thread stack frame whatever the runtime nz — identical work, identical answers

$$\text{cost ratio} = t(\text{NZ_STACK_MAX}=128) \div t(\text{NZ_STACK_MAX}=nz+1)$$

- V100
- MI250X
- GH200
- Intel Max

cost ratio, production ÷ fitted

V100, GH200 and Intel Max sit on 1.0
